From these studies, remarkable differences emerge between tumors localized in the right colon, compared to those localized in the left colon and rectum. Microsatellite instability is characterized by somatic alterations in the specific areas of the genome containing microsatellites short sequences of nucleotide bases, repeated multiple times. Another recent study identified two novel candidate genes for early-onset colorectal cancer susceptibility: This hypothesis is supported by various lines of evidence: These findings suggest that the metastatic process is a direct consequence of the loss of dependency of specific niche signals []. In this context, the available evidence suggests that medullary colon cancer is associated with microsatellite instability MSI and seems to be associated with a better prognosis, while signet-ring cell carcinomas have a poor prognosis. Colorectal cancer is a highly heterogeneous disease that comprises different tumor phenotypes. Thus, a set of studies have explored the mutational concordance of colorectal this reason, Eide and coworkers recently developed a CMS scaller, an algorithm for CMS classification in the absence of human tumor stroma [].
